

The histogram displays the frequency of Kimura substitution levels for two groups: 'All' (yellow bars) and 'Non-ambiguous' (purple bars). The x-axis, labeled 'Kimura substitution level', ranges from 0 to 50. The y-axis represents the frequency of observations. The 'All' distribution is centered around a substitution level of approximately 22, while the 'Non-ambiguous' distribution is shifted to the right, peaking around 24. This indicates that the 'Non-ambiguous' group generally has higher Kimura substitution levels compared to the 'All' group.
